

Vitamin E for Dogs Provides Powerful Antioxidant Benefits

Many different vitamins, minerals and other nutrients are essential for your dog's overall health, but vitamin E for dogs is one of the most important of all.

For one thing, vitamin E is an absolutely indispensable antioxidant. In fact, it's one of the most powerful antioxidants nature has to offer.

Benefits Of This Supplement Can...

Reduce the number of free radicals that are formed in your dog's body, which in turn helps prevent the damage that can be caused by those free radicals

Delay the onset of signs of aging, and slow the aging process

Invalidate your dog's immune system and provide important support to keep it healthy and strong

Improve cardiac health and promote a strong cardiovascular system by improving the circulation

Support cellular health by maintaining the integrity of cell membranes

Support respiratory health

Promote a healthy nervous system

Promote a healthy coat

Prevent or delay the formation of cataracts

Regulate digestion

Reduce the redness and itchiness caused by certain allergies through anti-inflammatory properties

This supplement is a fat-soluble antioxidant that's incredibly healthy for your dog.

Magnesium Deficiency in Dogs.

As a co-factor of VitD, magnesium is the best way to maximise vitamin D supplementation.

A deficiency in magnesium (also known as hypomagnesemia) is a serious health concern. As magnesium deficiencies worsen, numbness, tingling, muscle contractions and cramps, seizures, personality changes, abnormal heart rhythms, and coronary spasms can occur. Hip & joint problems together with kidney stones occur from lack of magnesium keeping the calcium liquid.

Impact of Cooking, Storage and Processing

The impact of cooking and processing of food on magnesium levels can vary greatly from food to food, since magnesium is found in different forms in different types of food. In some foods, where a greater % of magnesium is found in water-soluble form, blanching (boiling or steaming for 1-4 minutes), steaming, or boiling of these foods can result in a substantial loss of magnesium. MgT as used in PetLIFE is easily absorbed & is the only magnesium to cross the blood brain barrier to preserve brain functions. Keeping your dog sane....

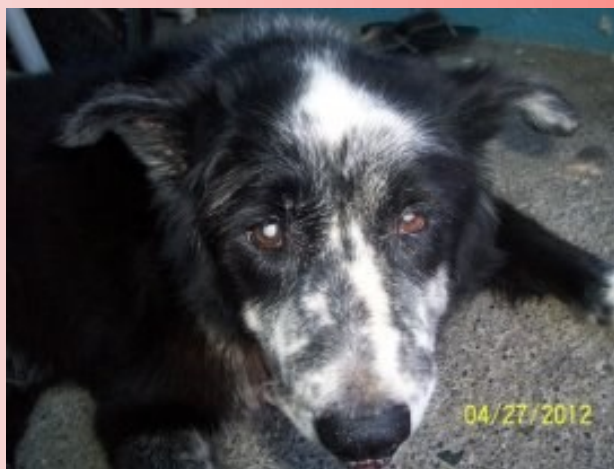

We have pioneered a mix of spray Vitamins D & E & Mg.

Why: In 2009 I was a service volunteer in the Philippines & many children needed Vitamin D to stabilise asthma attacks. Then my dog, Beau (below) caught asthma & the same therapy was used with him. It was an exact formula to stop his attacks & it worked every time. Vitamin E & Mg are also a forgotten miracles so we then added for pets. The benefits are outlined in the adjacent column.

Knowing the ratios to prevent attacks in children & my dog, & in consultation with experts we formulated **PetLIFE** spray that will improve your dog's health so much, Vets bills will be a reduced 70% or more & so far life expectancy will increase by 30%. Beau, my Border Collie just ticked over 19y/o, & he's still healthy if not a little slow. You won't know your dog after a month using **PetLIFE**. And the bonus of keeping him alive much longer makes it seem all worth while.

How much: It is a ratio of the dog's weight, their age & activity levels. One thing we are sure of, unless he lies in the sun & is outside a lot he will be vitamin D deficient. A quick spray of the required volume onto his food or into his bowl is all it takes. Our website will soon give you access to the **PetLIFE** calculator & you're all set up. He died at nearly 20y/o.

We miss Beau terribly.

Pets Health & Longevity PetLIFE 400 Vitamins D3, E & Mgt Spray

Vitamin D3 Magic

Why a Sublingual (Intraoral) Spray? It is scientifically proven that the most effective way to take supplements, is by intraoral delivery (under the tongue). It's not how much you take but how much your body tissues absorb that is important. Intraoral spray is rated at a 95% absorption rate. The other benefit is having your pet take it when sprayed onto their food or into their drinks.

The studying of Vitamin D3 is huge industry, concentrating on humans & other animals are mostly neglected. The good news is our pets metabolisms are so similar to ours & it appears the many benefits below will ultimately be proven to be applicable to all animals.

Give your pet the benefits of a rapid, effective response and recovery that Vitamin D3 ingredients in the **PetLIFE Intraoral Spray** provides:

- increased activation of anti-aging and longevity benefits.
- Hypertension (High Blood Pressure)
- super antioxidant abilities to boost and strengthen the immune system (without a strong, healthy immune system all life can easily be attacked by environmental toxins).
- increased metabolism and increased endurance.
- helps maintain healthy weight and the building of new lean muscle tissue.
- provides a much needed, deeper, rejuvenated night's sleep (extremely important as a good night's sleep offers many health benefits).
- supports joint, mobility and cardiovascular functions and a healthy heart.
- heals and repairs the body, providing rapid recovery after exercise or operations
- Rejuvenation of skin & hair.
- Autoimmune Diseases
- Rheumatoid Arthritis
- Heart Disease
- Cancers
- Much more energy.
- Diabetes

PetLIFE 400 D3 Spray: I like to think of PetLIFE 400, as a form of "supplemental health insurance" for pets, providing whatever extra nutrients your dog or cat needs to maintain optimum health.

Pet Food is the only industry that is allowed to lie to consumers. Current regulations allow 'direct unqualified claims' on pet food labels and pet food advertising. What are the symptoms would be for dogs and cats suffering from Vitamin D deficiency...

"Most common signs of vitamin D deficiency are lameness and poor mineralization of bone, especially in pups and kits. Signs of the classical disease, rickets, are most obvious in fast-growing, thus larger breed dogs. Affected animals will be lethargic, lose muscle mass (probably due to lethargy and presumably pain) and run slower than other dogs. While the taste may appeal to your dog the vitamin content is negligible.

Therefore, the average vitamin or mineral supplement for dog's contain large quantities of nutritional yeast and powdered liver to improve their flavor and small if not negligible quantities of vitamins and minerals. It is also a fact that pet vitamins usually come from poor quality sources. If a few inexpensive components are placed in a flavored mix, your pet is getting

flavor and not a complete formula. Vitamins and minerals provide the body with the correct tools to stay healthy. investigate The allegations are concerning Chinese Vitamin D supplements in animal foods.

Vitamin D bioavailability; resulting problems have been a large number of reports of Vitamin D deficiency problems in animals fed supplements with the Chinese Vitamin D. Lesson #1 to learn about Pet Food...

Do not purchase a dog food or cat food based on 'claims' stated on the label or in any advertising.

Remember, they are allowed to make direct unqualified claims! (a lie).

SUNLIGHT, CANCER and VITAMIN D.

Cancer rates are spiralling out of control in dogs. Bone and joint deformities plague breeders. Every time you turn around there's a *new* genetic disease in dogs. It is *not* because veterinary research is discovering new diseases- it is because our dogs are getting sicker!

All mammals require sunlight. We must turn to nature to protect our health, starting with the sun. Avoidance of sunlight to prevent cancer is a serious misconception which, like low-fat diets that encourage people to eat chemical-laden fake food, has seriously bad effects on reproduction, growth, and the immune system. We adversely affect our dog's health and reproductive ability by keeping them indoors, in fact, "house dogs" - our closest friends, are the most affected by sunlight deprivation. Lack of sunlight prevents absorption of vitamin D but it doesn't stop there. Cancer is on the rise in dogs as well as humans. What we now know is that vitamin D may also help prevent a variety of cancers! Could that explain the higher cancer rate among pampered pets and show dogs? Could it be that they spend more time indoors than the street mutt or hunting dog? Even so, sunlight's beneficial biological effect seems to have been lost to modern medicine and those who keep animals. The SUN is healthy.
